What is OCaml?

Statically Typed Functional Programming Language

Assignment Project Exam Help

- Types approximate runtime behaviour
- Analyze programs **before** executing them
- Find and fix bugs before testing
- Primary expressions are functions!
- Functions are first-class!
- Pure vs Not Pure
- Call-By-Value vs Lazy

<https://powcoder.com>

Add WeChat powcoder

- Writing and executing basic expressions
- Learn how to read error message
- Names, Values, Basic Types
- Variable, Bindings, Scope of Variables
- Simple Functions

Step 2: Variables and Bindings

- Variable binding is not an assignment
- Variables cannot be updated — we can only overshadow a previous binding
- Variable bindings persist
- Garbage collection disposes off variable bindings that are not needed anymore
- Variable bindings are local — they exist within a scope
- Variables are bound to a value — not an expression

- Professor at MIT
- John von Neumann Model [2014]
- Turing Award for her work in the design of programming languages and software methodology [2006]

<https://powcoder.com>

"The motivation behind the work in very-high-level languages is to ease the programming task by providing the programmer with a language containing primitives or abstractions suitable to his problem area. The programmer is then able to spend his effort in the right place; he concentrates on solving his problem, and the resulting program will be more reliable as a result. Clearly, this is a worthwhile goal."

B. Liskov [1974]

- Functions are values
- Function names establish a binding of the function name to its body

```
let area (r: float) = pi *. r *. r;;
```

<https://powcoder.com>

Add WeChat powcoder

- Functions are values
- Function names establish a binding of the function name to its body

```
let area (r: float) = pi *. r *. r;;
```

- Recursive functions are declared using the keyword `let rec`

```
1 let rec fact n =  
2   if n = 0 then 1  
3   else n * fact (n-1)  
4
```

Tail-recursive Functions

A function is said to be "tail-recursive", if there is nothing to do except return the final value. Since the execution of the function is done, saving its stack frame (i.e. where we remember the work we still in general need to do), is redundant.

- Write efficient code
- All recursive functions can be translated into tail-recursive form!

Tail-recursive Functions

A function is said to be "tail-recursive", if there is nothing to do except return the final value. Since the execution of the function is done, saving its stack frame (i.e. where we remember the work we still in general need to do), is redundant.

- Write efficient code
- All recursive functions can be translated into tail-recursive form!

Example: Rewriting Factorial

```
1 let rec fact_tr1 n =  
2   let rec f (n, m) =  
3     if n=0 then  
4       m  
5     else f(n-1, n*m)  
6   in  
7     f(n, 1)
```

<https://powcoder.com>

- Second parameter to accumulate the result; in the base case we simply return its result
- Avoids having to return a value from the recursive call and subsequently doing further computation.
- Avoids building up a runtime stack to memoize what needs to be done once the recursive call returns a value

Add WeChat powcoder

Example: Rewriting Factorial

```
1 let rec fact_tr1 n =  
2   let rec f (n, m) =  
3     if n=0 then m  
4     else f(n-1, n*m)  
5   in  
6   f(n, 1)
```

What is the type of f?

- Passing all arguments at the same time

Assignment Project Exam Help

- Passing one argument at a time

$'a \rightarrow 'b \rightarrow 'c$

- **Remark:** We can translate any function of type $'a \rightarrow 'b \rightarrow 'c$ to a function of type $'a * 'b \rightarrow 'c$ and vice versa. This is called *currying* (*uncurrying* resp.)

User-Defined (Non-Recursive) Data Type

```
1 type suit = Clubs | Spades | Hearts | Diamonds
```

Assignment Project Exam Help

- The order in which we declare these elements does not matter.
- We call Clubs, Spades, Hearts, Diamonds **constructors**.
- **Constructors** must begin with a capital letter in OCaml.
- Use **pattern matching** to analyze elements of a given type.

```
1 match <expression> with
2   | <pattern> -> <expression>
3   | <pattern> -> <expression>
4   | ...
5   | <pattern> -> <expression>
```

Add WeChat powcoder

A pattern is either a variable, underscore (wild card), or a constructor.

Comparing Suits

Write a function `dom` of type `suit*suit -> bool`

`dom(s1 s2) = true` iff `suit s1` beats or is equal to `suit s2`
relative to the ordering

Spades > Hearts > Diamonds > Clubs

<https://powcoder.com>
