1 Lecture 1 < 2017-09-12 Tue>

This course is an introduction to the foundations and paradigms of programming languages.

- 5 assignments, 5% each
- 10% midterm
- 65% final
- You have two late days for the semester (cumulative)

1.1 Four main goals of COMP 302

- 1. Provide thorough introduction to fundamental concepts in programming languages
 - Higher-order functions
 - State-full vs state-free computation (most languages like Java we've seen are state-full)
 - Modeling objects and closures
 - Exceptions to defer control
 - Continuations to defer control
 - Polymorphism
 - Partial evaluation

Assignment Project Exam Help

- Etc.
- Want to explore these concepts to you can recognize them in another language of swide about the point of the concepts to you can recognize them in
- 2. Show different ways to reason about programs

AddkiWeChat powcoder

- One of the best inventions
- Checks what it expects and will actually tell you where it expects something
- Program is more likely to be correct now
- Induction
 - Proving a program/transformation correct
- Operational semantics
 - How a program is executed
- QuickCheck
- 3. Introduce fundamental principles in programming language design
 - Grammars
 - Parsing
 - Operational semantics and interpreters

- Type checking
- Polymorphism
- Subtyping
- 4. Expose students to a different way of thinking about problems
 - It's like going to the gym; it's good for you!

1.1.1 How we achieve these goals

- Functional programming in OCaml
 - Equal playing field
 - * No one in the class really knows it, not affected by performance in previous classes like 250

Assignmental Project je Exeaund Helpe

- * Isolates lots of the concepts individually
- states see the property of t
- Statically typed language enforces disciplined programming

A de de Wees that powered terintenance

- Easy to reason about runtime behavior and cost

1.1.2 Guiding Principles

- No point in learning a programming language unless it changes how you view programming
- Simple and elegant solutions are more effective, but harder to find than the complicated ones, take more time.
 - You spend very little time testing OCaml code and more time compiling it

1.1.3 Why do I need to know this

- Science and craft of programming
- Skills you learn will help you become a better programmer
 - More productive
 - Code easier to maintain and read
 - Etc.
- Will be needed in some upper level courses
 - Like compilers, etc.
- It is cool and fun!
- You might even get a job!

Assignment Project Exam Help

• Can do assignments in groups of 2

1.3 Mishttps://powcoder.com

- Lectures won't be recorded.
- Slides may be posted but leave the set on My-Courses (most essential reading)

2 Lecture 2 < 2017-09-14 Thu>

2.1 What is OCaml

• Statically typed functional programming language

2.1.1 Statically typed

- Types approximate runtime behavior
- Analyze programs before executing them
- Find a fix bugs before testing
- Tries to rule out bad scenarios
- Very efficient, very good error messages, very good maintenance tool

2.1.2 Functional

- Primary expressions are functions!
- Functions are first-class!
 - Not only can we return base types like ints, we can return functions and pass them as arguments too
 - One of the key features of functional languages
- Pure vs Not Pure languages
 - Haskell is Pure
 - * Doesn't give you ways to allocate memory or directly modify memory

Assignment Project Exam Help

- Call-By-Value vs Lazy
 - https://powcoder.com

2.1.3 Concepts for Today

- Writing an electivistic practice bowcoder
- Learn how to read error messages
- Names

2.1.4 OCaml demo in class

- Always have to finish a line with 2 semi colons ;;
- Can use interpreter by launching OCaml in shell
- Functional good for parallel computing
- Good to reason about these programs
- int:
 - -1;;
 - -1+3;;

- Strings:
 - "Hello";;
- Floats:
 - -3.14;;
- Booleans:
 - true;;
- if
- if 0=0 then 1.4 else 2.1;;

1. Operators

Assignment Project Exam Help

- Take as input 2 int, return int

- $3.14 + 1 ;; \rightarrow \text{error}$
- https://proceedings.com a dot. Only works with floating points, no ints

-3.14 + 2.4 ;;

2. TypeAdd WeChat powcoder

- Approximate the runtime behaviour
- Types classify expressions according to the value they will compute
- Won't execute right away, will think of types you are returning to see if it's valid
- if 0=0 then 1.4 else 3;;
 - Error, after reading 1.4 expects 3 to be float
- if bool then T else T
 - Both Ts have to be the same type
- Type checker will allow 1/0;; to run, but will have a runtime exception
 - int/int is not enough info to know that your dividing by 0
- 3. Vars

- let pi = 3.14;;
- let (pi : float) = 3.14;;
- let m = 3 in
 - let n=m * m in
 - let k=m*m in
 - k*n ;;

4. Binding

- let m = 3;; puts it on the stack
- let m = 3 in ...
 - m is a local variable now (temporary binding), once you hit ;;, won't have m anymore
 - Garbage collector

Assignment Project ExamHelp-

• variables are bind to values, not assigned values

https://powcoder.com

- - let area = function r -> pi *. r *. r ;;
 - let area r = pi *. r *. r ;;
 - let a4 = area(2.0);;
 - If you redefine pi, like let pi = 6.0;
 - area(2.0) will still give you the same thing
 - The function looks up in the past
 - Stack:

pi	6.0
area	function $r \rightarrow p *. r *. r$
k	5
k	4
pi	3.14

• Can redefine the function though

Lecture 3 < 2017-09-15 Fri> 3

3.1 **Functions**

- Functions are values
- Function names establish a binding of the function name to its body
 - let area (r:float)=pi*. r *. r ;;

Recursive functions 3.1.1

Recursive functions are declared using the keyword let rec

- let rec fact n =
 - if m = 0 them 1

Assignment-Project Exam Help

- fact 2 needs to be stored on the stack
- fact https://powcoder.com
 fact 1 -> 1* fact 0 stored on stack

- so need to store on the stack
 - What's the solution to this? How is functional programming efficient?
- 1. Tail-recursive functions A function is said to be "tail-recursive", if there is nothing to do except return the final value. Since the execution of the function is done, saving its stack frame (i.e. where we remember the work we still in general need to do), is redundant
 - Write efficient code
 - All recursive functions can be translated into tail-recursive form
- 2. Ex. Rewrite Factorial
 - let rec fact tr n =
 - let rec f(n,m) -

- * if n=0 then
 · m
 * else f(n-1,n*m)- in
 * f(n,1)
- Second parameter to accumulate the results in the base case we simply return its result
- Avoids having to return a value from the recursive call and subsequently doing further computation
- Avoids building up a runtime stack to memorize what needs to be done once the recursive call returns a value
- $f(2,1) \rightarrow fact(1, 2*1) \rightarrow fact(0,2) \rightarrow 2$

- What is the type of fact_tr? fact_tr: $int(input) \rightarrow int(output)$
- · https://powcoder.com
 - n-tuples don't need to be of the same type, can have 3 different types, like int*bool*string

3.1.2 Add WeChat powcoder Passing arguments

- ' means any type, i.e. 'a
 - All args at same time
 - 'a*'b -> 'c
 - One argument at a time
 - 'a -> 'b -> 'c
 - May not have a and b at the same time. Once it has both it will get c.
 - We can translate any function from one to the other type, called currying (going all at once to one at a time) and uncurrying (opposite).
 - Will see in 2 weeks

Data Types and Pattern Matching

3.2.1 Playing cards

- How can we model a collection of cards?
- Declare a new type together with its elements
- type suit = Clubs | Spades | Hearts | Diamonds
 - Called a user-defined (non-recursive) data type
 - Order of declaration does not matter
 - * Like a set
 - We call clubs, spades, hearts, diamonds constructors (or constants), also called elements of this type

SSIGNMENT Project Exam He • Use pattern matching to analyze elements of a given type.

• match <expression > with ttps://powcoder.com

Add WeChat powcoder

<pattern> -> <expression>

A pattern is either a variable or a ...

- Statements checked in order
- 1. Comparing suits Write a function dom of type suit*suit -> bool
 - dom(s1,s2) = true iff suit s1 beats or is equal to suit s2 relativeto the ordering Spades > Hearts > Diamonds > Clubs
 - (Spades,) means Spades and anything
 - $(s1, s2) \rightarrow s1=s2$ will return the result of s1=s2
 - Compiler gives you warning if it's not exhaustive and tells you some that aren't matched

Lecture 4 < 2017-09-19 Tue>

4.1 Data Types and Pattern Matching Continued

- Type is unordered
- type suit = Clubs | Spades | Hearts | Diamonds
 - Order doesn't matter here, but they must start with capitals
- type rank = Two | Three | ...
- type card = rank * suit

What is a hand? A hand is either empty or if c is a card and h is a hand then Hand(c,h). Nothing else is a hand. Hand is a constructor. hand is a type. (capitalization mattersA)

Assignment Project Exam Help Inductive or recursive definition of a hand

Add a card to something that is a hand, still a hand https://powcoder.com Recursive data type

4.1.1

- type hand = Empty | Hand of card * hand
- 1. Typing Adder We Chat powcoder
 - Empty;;
 - hand = Empty
 - let h1 = Hand ((Ace, Spades), Empty);;
 - Want only 1 card, so include empty
 - Recursive data type, so it needs another hand in it
 - let h2 = Hand ((Queen, Hearts), Hand((Ace, Spades), Empty);
 - Recursive
 - let h3 = Hand ((Joker, Hearts), h2);;
 - Error, Joker not defined
 - type 'a list = Nil | Cons of 'a * 'a list
 - Hand ((Queen, Hearts), (King, Spades), (Three, Diamonds));;
 - Hand has type? card * card * card
 - Get an error, because constructor Hand expects 2 arguments (card+hand)

4.1.2 Extract Example

- Given a hand, extract all cards of a certain suit
- extract: suit -> hand -> hand

```
let rec extract (s:suit) (h:hand) = match h with
  | Empty -> Empty (* We are constructing results, not destructing given hand *)
  (* Want to extract suit from first card *)
  | Hand ( (r0.s0) ,h) ->
        (*Make a hand with first card and remaining results of recursive ext*)
    if s0 = s then Hand( (r0, s0), extract s h0)
    else extract s h0
```

Hand is "destroyed" through this method, but old hand stays the same, it is not modified.

Assignment Project Exam Help Running extract Spades hands;; will give a new hand with only spades

- Good exercise, write a function that counts how many cards in the hand $\frac{https://powcoder.com}{}$
- Can we make this thing tail recursive?

- extract' Spades hand5 Empty;;
- Gives same cards but in the reverse order of extract
- extract Spades hand5 = extract' Spades hand5 Empty ;;
 - False
- Write a function find which when given a rank and a hand, finds the first card in hand of the specified rank and returns its corresponding suit.

What if no card exists?

- Optional Data Type (predefined)
- type 'a option = None | Some of 'a

5 Lecture 5 < 2017-09-21 Thu>

```
(* type mylist = Nil | Cons of ? * list;; *)
(* Polymorphic lists: *)
(* type 'a mylist = Nil | Cons of 'a * 'a my list *)
[];;
1 :: [] ;;
1 :: 2 :: 3 :: [] ;;
[1;2;3;4];;
(* These ere only homogenous lists though, what if we want floats and ints? *)
(* type if_list = Nil | ICons of int * if_list | FCons of float * if_list *)
(* But here we can't use List libraries *)
         nttps://powcoaer.com
(* So make an element that can be either *)
type elem = I of int | F of float;;
                   WeChat, powcoder
let rec append
  | [] -> 12
  | x::xs -> x :: append xs 12;;
(* Program execution *)
(* append 1::(2::[]) -> 1 :: append (2::[])
                                                      *)
let head 1 = match 1 with
  | [] -> None
  | x :: xs -> Some x;;
(* Write a function rev given a list 1 of type 'a list returns it's reverse *)
(* Silly way of doing this
                                      *)
let rec rev (1 : 'a list) = match 1 with
  | [] -> []
  | hd :: tail -> rev (tail) @ [hd];;
(* Could we have written rev(tail) :: hd? No. Why? *)
(* a' : 'a list, left side has to be one element, right side to be a list *)
```

```
(* 'a list @ 'alist *)

(* What is the type of rev? Is it 'a list? -No *)
(* It is 'a list -> 'a list *)

(* Is this a good program? Long running time, use tail recursion *)

let rev_2 (1 : 'a list) =
  let rec rev_tr 1 acc = match 1 with
    | [] -> acc
    | h::t -> rev_tr t (h::acc)
    in
    rev_tr 1 [];;
```

Assignment Project Exam Help

* Write a function merge: 'a list -> 'a list -> 'a list which given ordered lists 11 and 12, both of type 'a list, it returns the sorted combination of both lists * Write a function splp. Owner Office Offi

Add WeChat powcoder

What are lists?

- Nil([]) is a list
- Given an element x and a list l x::l is a list
- Nothing else is a list
- [] is an ' α list
 - Given an element x of type ' α and l of type ' α list x l is an ' α list (i.e. a list containing elements of type ' α)
- ; are syntactical sugar to separate elements of a list

5.2 Execution

Understand how a program is executed

• Operational Semantics

```
6 Lecture 6 < 2017-09-22 Fri>
```

6.1 Proofs

```
6.1.1 Demo: lookup & insert
```

```
(* Warm up *)
(* Write a function lookup: 'a -> ('a * 'b) list -> 'b option.
Given a key k of type 'a and a list l of key-value pairs,
return the corresponding value v in l (if it exists). *)
(Alcokup rancent 'Prist ectopic am Help
let rec lookup k l = match l with
[] -> None
| (k',v')::t -> if k=k' then Some v' (* If it is the right key, return val*)
else lookup S://DOWCOGET.COM

(* Write a function insert which
given a key k and avalue and an ordered list l of type ('a * 'b) list
it inserts heldey-value pair (A) into two Girl of type
preserving the order (ascending keys). *)
(* insert: ('a * 'b) -> ('a * 'b) list -> ('a * 'b) list
insert (k,v) l = l'
Precondition: l is ordered.
```

Postcondition: 1' is also ordered and we inserted (k,v) at the right position in 1*)

```
* let l = [(1, "anne"); (7, "di")];;
 * 1;;
 * let 10 = insert (3, "bob") 1;;
 * insert (3,"tom") 10 ;;
 * (\* But now we'll have 2 entries with the same key *\) *)
(* Undesirable, better to replace the value if its a dictionary*)
let rec insert (k,v) 1 = match 1 with
  | [] -> [(k,v)]
(* k = k' \text{ or } k < k' \text{ or } k' < k *)
  | ((k',v') \text{ as } h) :: t \rightarrow
    if k = k' then (k,v) :: t (* Replace *)
    ssignment Project Exam Help
(* Personal tail recursive attempt *)
let inser http. vs. / powcoder.com
    | [] -> acc @ [(k,v)]
    | ((k',v') as h) :: t ->
                th WeChat powcoder
 if k' < k then (k,v) :: 1
 else insert_acc (k,v) t (acc @ [h])
```

• What is the relationship between lookup and insert?

6.1.2 How to prove it?

- 1. Step 1 We need to understand how programs are executed (operational semantics)
 - $e \Downarrow v$ expression e evaluates in multiple steps to the value v. (Big-Step)
 - $e \Rightarrow e'$ expression ee evaluates in one steps to expression e'. (Small-Step (single))
 - $e \implies *e'$ expression e evaluates in multiple steps to expression e' (Small-Step (multiple))

For all l, v, k, lookup k (insert k v l) \implies * Some v Induction on what?

- 2. Step 2 P(l) = lookupk (insert(k, v)l) \Downarrow Some v
 - How to reason inductively about lists?
 - Analyze their structure!
 - The recipe ...
 - To prove a property P(l) holds about a list l
 - * Base Case: l = []
 - · Show P([]) holds
 - * Step Case: l = x :: xs
 - · IH P(xs) (Assume the property P holds for lists smaller than l)

Assignment Projecto Examy Helpr

- 3. Theorem For all l, v, k, lookup k (insert (k, v)l) \implies * Some v
- 4. Proofittps://ctpowcoder.com
 - Case: l = []

$A \underset{-}{\overset{\text{lockup}}{\Longrightarrow}} \overset{\text{Wiser (k, What powcoder}}{\underset{\text{lockup k [(k,v)] (same as (k,v)::[])}}{\overset{\text{By lockup}}{\Longrightarrow}}$

Some v

- * Would not hold if we didn't put the k=k case
- Case: l = h :: t where h = (k', v')
 - IH: For k, v lookup k (insert (k, v) t) \Downarrow Some v
 - To show: lookup k (insert (k,v)) $\underbrace{(k',v')::t}_l \Downarrow$ Some v
 - Subcase: k = k'
 - * lookup k (insert (k,v) ((k', v')::t))
 - $* \stackrel{\mathrm{By\ insert}}{\Longrightarrow} lookup\ k\ ((k,\!v)::t)$
 - $* \stackrel{\text{By lookup}}{\Longrightarrow} \text{Some v (good)}$
 - Subcase: k < k'
 - * lookup k (insert(k,v) ((k',v'):: t))
 - $* \stackrel{\text{By insert}}{\Longrightarrow} lookup \ k \ ((k,v)::l)$

```

* & \overset{\text{By lookup}}{\Longrightarrow} & \text{Some v (good)} \\
- & \text{Subcase: } k > k' \\
* & \text{lookup k (insert(k,v) ((k',v')::t))} \\
* & \overset{\text{By insert}}{\Longrightarrow} & \text{lookup k ((k', v')::insert (k,v) t)} \\
* & \overset{\text{By lookup}}{\Longrightarrow} & \text{lookup k (insert (k,v) t)} \\
* & \overset{\text{By IH}}{\Longrightarrow} & \text{Some } v
\end{array}
```

5. Lesson to take away

- State what you are doing induction on
 - Proof by structural induction in the list l
- Consider the different cases!
- \bullet For lists, there are two cases- either l = [] or l = h :: t

Assignment Project Exam Help

- IH: For all v,k, lookup insert (k,v) t \Downarrow Some v
- Justify your evaluation / reasoning steps by https://www.cockerprecom
 - The induction hypothesis
 - Lemmas/Properties (such as associativity, commutativity)

Add WeChat powcoder

7 Lecture 7 <2017-09-26 Tue >

7.1 Structural Induction

- How do I prove that all slices of cake are tasty using structural induction?
 - Define a cake slice recursively
 - Prove that a single piece of cake is tasty
 - Use recursive definition of the set to prove that all slices are tasty
 - Conclude all are tasty

7.1.1 Example with rev

```
(* naive *)
(* rev: 'a list -> 'a list *)
let rec rev l = match l with
```

```
| [] -> []
| x::1 -> (rev 1) @ [x];;

(* tail recursive *)
(* rev': 'a list -> 'a list *)
let rev' 1 =
    (* rev_tr: 'a list -> 'a list -> 'a list *)
let rec rev_tr 1 acc = match 1 with
    | [] -> acc
    | h::t -> rev_tr t (h::acc)
in
rev_tr 1 [];;

(* Define length *)
let rec length 1 = match Project Exam Help
| h::t -> 1+length t
```

- 1. Theorem: For all lists l, rev l = rev' l. lercomerce What is the relationship between l, acc and rev_tr l acc?
 - Invariant of rev Add 1 Wee Chat powcoder
 - \bullet Invariant rev_tr
 - $\ length \ l + length \ acc = length (rev_tr \ l \ acc)$
 - How are these related?
 - rev l ↓
 - \bullet rev tr l acc \downarrow v
 - Not quite because:
 - $-\operatorname{rev} \left[\right] \downarrow \left[\right]$
 - $-\operatorname{rev_tr} []\operatorname{acc} \Downarrow \operatorname{acc}$
 - Not returning the same thing given empty list
 - Slightly modified so it's right:
 - rev l @ acc \Downarrow v

```
- \text{ rev\_tr l acc} \Downarrow \text{v}
```

For all l, acc, (rev l) @ acc \Downarrow v and rev_tr l acc \Downarrow v By induction on the list l.

- Case l=[] rev [] @ acc $\xrightarrow{prog rev} [] @ acc \rightarrow acc$ $rev_tr [] acc$ $\xrightarrow{by prog rev_tr} acc$
- Case l = h :: t

- IH: For all acc rev t @ acc ↓ v and rev_tr t acc ↓ v

Assignmental Forceth Lexan Help * By associativity of @ rev t @ ([h] @ acc)

- By the IH rev t @ (h::acc) \Downarrow v and rev_tr t (h::acc) \Downarrow v

7.2 TreeAdd WeChat powcoder

```
and 'a many_trees = Empty | MoreTrees of 'a many_trees

(* Mutually recursive *)

let rec size_forest f = match f with
    | Forest trees -> match trees with
    | [] -> 0
    | h::t -> size_many_trees h + size_forest (Forest t)

and size_many_trees t = match t with
    | NoTree -> 0
    | MoreTrees f -> 1 + size_forest f
```

8 Lecture 8 < 2017-09-28 Thu> Assignment Project Exam Help

- The empty binary tree empty is a binary tree
- If land type any tree Node(v, l, r) is a binary tree
- Nothing else is a binary tree Add WeChat powcoder How to define a recursive data type for trees in OCaml?

```
type 'a tree =
Empty
| Node of 'a * 'a tree * 'a tree |
```

8.2 Insert

Want to make a function insert

- Given as input (x,dx), where x is key and dx is data and a binary search tree t
 - Return a binary search tree with (x,dx) inserted
 - What is insert's type? $* (a' * b') \rightarrow ('a \times 'b) \text{tree} \rightarrow ('a \times 'b) \text{ tree}$

```
    Good exam question

(* Data Types: Trees *)
type 'a tree = Empty | Node of 'a * 'a tree * 'a tree
let rec size t = match t with
  | Empty -> 0
  \mid Node (v, l, r) \rightarrow 1 + size l + size r
let rec insert ((x,dx) as e) t = match t with
  (* Tree is empty, root is now e *)
  | Empty -> Node (e, Empty, Empty)
   Assignment Project, Exam Help
     (* No destructive updates, need to keep elements and remake tree *)
     if x = y then Node (e, 1, r)
(* Go downlettp:See/*/powcoder.com else (if x < y then Node ((y,dy), insert e 1, r)
      (* Go down right tree *)
  a Add Wethat powcoder
    (* Can we still use these less than signs for any type?
     The node constructor uses any type
     Since we used comparison, we can*)
;;
3 < 4;
Empty < Node (3, Empty, Empty);;</pre>
Node (3, Empty, Empty) < Node (4, Empty, Empty) ;;
[3; 4] < [2; 5];;
(* Why is this false? *)
[3;5] < [4;7];;
[3;5]<[7];
(* Doesn't look at length of list, looks at first number of list *)
```

• Good exercise: write a function to check if a tree is a binary search

tree or not

Assignment Project Exam Help

8.3 Proving

• How to reason inductively about trees? Analyze their structures!

8.4 Theorem

For all trees t, keys x, and data dx, lookup x(insert (x, dx) t) \Rightarrow * Some dx

8.4.1 Proof by structural induction on the tree t

(You get points on an exam for mentioning what kind of induction, structural induction on tree, points for base case/case, points for stating induction hypothesis, perhaps multiple. Then show by a sequence of steps of how to get from what to show to the end)

- Case t = Empty
 - lookup x (insert (x, dx) Empty) $\stackrel{\text{By insert}}{\Rightarrow}$ lookup x (Node ((x,dx), Empty, Empty)) $\stackrel{\text{by lookup}}{\Rightarrow}$ Some dx
- Case t = Node ((y,dy), l, r)
 - Both trees l and r are smaller than t

Assignment, Polyogert(x, E) x amone de p

- Need to show lookup x (insert (x, dx) Node ((y, dy), l, r))
- · Showhttps://powcoder.com
 - $x < y \Rightarrow lookup \ x \ (Node((y,dy), insert (x,dx) \ l, \ r)) \overset{By \ lookup}{\Rightarrow} \ lookup$ $x \xrightarrow{\text{Ainsert}} (x, x) \overset{by \ IH}{\Rightarrow} \overset{1}{\Rightarrow} \underset{\text{by lookup}}{\text{bookup}} \text{OWCOder}$ $x = y \ lookup \ x (insert (x,dx) \ Node ((y, dy), \ l, \ r)) \overset{by \ lookup}{\Rightarrow} \ lookup \ x$ $(Node ((x,dx), \ l, \ r)) \overset{by \ lookup}{\Rightarrow} \text{Some dx}$

Exercise: write a type for cake (2 slice of cake together become 1 slice), with weight

9 Lecture 9 < 2017-09-29 Fri>

9.1 Higher-order functions

- Allows us to abstract over common functionality
- Programs can be very short and compact
- Very reusable, well-structured, modular
- Each significant piece implemented in one place

- Functions are first-class values!
 - Pass functions as arguments (today)
 - Return them as results (next week)

9.1.1 Abstracting over common functionality

Want to write a recursive function that sums up over an integer range: $\sum_{k=a}^{k=b} k$

```
let rec sum (a,b) =
if a > b then 0 else a + sum(a+1,b)
```

Now what if we want to make a sum of squares? $\sum_{k=a}^{k=b} k^2$

Assignment Project Exam Help

 $\sum_{k=a}^{k=b} 2^k$

let rec shttps://powcoder.com
if a > b then 0 else exp(2,a) + sum(a+1,b)

- So you can reimple nent the function every time, but it would be more useful to make a sum function that full sum up what you tell it to (what to do to each element)
- Non-Generic Sum (old)
 - int * int -> int
- Generic Sum using a function as an argument
 - (int -> int) -> int * int -> int

9.2 Demo

```
(* Arbitrary functions *)
(* cube, rcube, square, exp, sumInts, sumSquare, sumCubes, sumExp *)
let square x = x * x;;
let cube x = x * x * x;;
let rec exp (a, b) = match a with
```

```
(* Non-generalized sums *)
 let rec sumInts (a,b) = if (a > b) then 0 else a + sumInts(a+1,b);;
let rec sumSquare(a,b) = if (a > b) then 0 else square(a) + sumSquare(a+1,b);;
let rec sumCubes(a,b) = if (a > b) then 0 else cube(a) + sumCubes(a+1, b);;
(* We will abstract over the function f (i.e. cube, square, exp etc)
to get a general sum function*)
(* sum: (int -> int) -> int * int -> int *)
let rec sum f(a,b) =
  if a > b then 0
  else f(a) + sum f(a+1, b);;
Assignment Project Exam Help
(* Identity function, returns Argo *)
let id x https://powcoder.com
(* let sumInts' (a,b) = sum id (a,b);; *)
(* anonymous churchion * Chat powcoder let sumInts' (a,b) = sum (fun x -> x p(a,b);;
(* let sumSquare' (a,b) = sum square(a,b);; *)
let sumSquare' (a,b) = sum (fun x -> x * x) (a,b)
let sumCubes' (a,b) = sum cube(a,b);;
(* let sumExp' (a,b) = sum exp2(a,b);; *)
let sumExp' (a,b) = sum (fun x-> exp (2,x)) (a,b);;
(* Inconvenient, we have to define a function beforehand *)
(* How can we define a function on the fly without naming it?
-> Use anonymous functions*)
(* Different ways to make anonymous functions *)
fun x y \rightarrow x + y;
function x -> x;;
```

```
fun x \rightarrow x;;
(* Can use function for pattern matching
Don't need to write match
Function can only take in one argument and implies pattern matching
 fun can take many *)
(function 0 -> 0 | n -> n+1);;
(* Equivalent to fun and match *)
(fun x \rightarrow match x with 0 \rightarrow 0 | n \rightarrow n+1);;
(* comb: is how we combine - either * or +
 f : is what we do to the a
 inc : is how we increment a to get to b
 base : is what we return when a > b *)
Assignment, Project Exam Help
  if a > b then base
  else series comb f (inc(a),b) inc (comb base (f a));;
(* Base aftstas as completer * oder.com
   • How about only summing up odd numbers?
let rec sun odd (1,b) We Chat powcoder if (a mod 2) Chat powcoder
sum (fun x \rightarrow x) (a, b)
else
sum (fun x \rightarrow x)(a+1, b)
   • Adding increment function
let rec sum f (a, b) inc =
if (a > b) then 0 else (f a) + sum f (inc(a), b) inc
let rec sumOdd (a,b) =
if (a \mod 2) = 1 then
sum (fun x \rightarrow x) (a, b) (fun x \rightarrow x+1)
sum (fun x -> x)(a+1, b) (fun x-> x+1)
   • How about only multiplying?
```

```
let rec product f (a, b) inc =
if (a > b) then 1 else (f a) * product f (inc(a), b) inc
```

• Can make this tail recursive with accumulators for base (1 for prod, 0 for sum)

• Types:

- (int -> int -> int) : comb
- series: -> (int -> int) : f
- int * int : a,b lower and upper bound
- int int : inc

Assignment Project Exam Help Types can get crazy, too much abstraction may lead to less readability

9.3 Borustps://powcoder.com

- $l = a + \frac{dx}{2} \frac{dx}{dt}$ We Chat powcoder
 - Left side of l is above the rectangle, right side is below, approximation should almost cancel them

$$-\int_{a}^{b} f(x)dx \approx f(l) * dx + f(l+dx) * dx + f(l+dx+dx) * dx + \dots = dx * (f(l) + f(l+dx) + f(l+2*dx) + f(l+3*dx) \dots)$$

$$\text{Want: sum: } \underbrace{(float -> float)}_{f} -> \underbrace{(float}_{l} * \underbrace{float}_{u}) -> \underbrace{(float -> float)}_{inc} ->$$

float

```
let integral f(a,b) dx =
dx * sum f (a+.(dx/2.),b) (fun x-> x+. dx)
(* Follows format of sum function above
Can easily write a short program like above*)
```

```

11 Lecture 11 <2017-10-05 Thu>

11.1 Lambda-Calculus

- Simple language consisting of variables, functions (written as $\lambda x.t$) and function application
- We can define all computable functions in the Lambda-Calculus
- Church Encoding of Booleans:

- $-T = \lambda x.\lambda y.x$ Keeps first argument, throws the other.
- F = $\lambda x.\lambda y.y$ Keeps second argument, throws the other.
- Lambda-Calculus is Turing complete, can do everything with it

11.2 Back to the beginning

```
(*Binding variables to functions*)
let area : float -> float = function r -> pi *. r *. r
(*or*)
let area (r:float) = pi *. r *. r
```

- The variable name area is bound to the value function r -> pi *. r *. r, which OCaml prints as <fun>
 - The type is float->float

 - * T*S is a type

11.3 Curry

let curry
$$f = fun \underbrace{x}_{\text{'a} * \text{'b} -> \text{'c}} = fun \underbrace{x}_{\text{'a}} \underbrace{y}_{\text{'b}} -> f\underbrace{(x, y)}_{\text{'a} -> \text{'b} -> \text{'c}}$$

$$\bullet \text{ curry } \underbrace{plus'}_{\text{int * int -> int}} : \text{ int -> int -> int}$$

- fun x y -> plus' (x,y)
 - OCaml gives you <fun>
 - Shouldn't we continue evaluation plus'(x,y) and get as a final result fun x y -> x + y?
 - * No, we never evaluate inside function bodies
 - * When OCaml sees fun, it stops looking
 - · It has a function, it's a value, it's done

11.4 Uncurrying

uncurry ('a -> 'b -> 'c) -> 'a * 'b -> 'c

• The type of functions is right associative

Assignment Project Exam Help

- Important to know how to read functions.
 - $\Pr_{-\text{dataleo have ples}}^{-\text{Fx, plus function from earlier}} \sum_{\text{dataleo have ples}}^{\text{function from earlier}} \sum_{\text{funcyo}}^{\text{der.com}} com$
 - * int -> (int -> int)

Add WeChat powcoder

11.5 Demo

We've already seen functions that return other functions: derivatives!

- (* Write a function curry that takes as input
- * a function f:('a * 'b)->c'
- * and returns as a result a function
- * 'a->'b->'c*)
- (* curry : (('a * 'b)->'c)-> 'a -> 'b -> 'c
- * Note: Arrows are right-associative. *)

let curry $f = (fun x y \rightarrow f (x,y))$

let curry_version2 f x y = f (x,y)

let curry_version3 = fun f \rightarrow fun x \rightarrow fun y \rightarrow f (x,y)

```
(* Uncurry *)
  (* uncurry ('a -> 'b -> 'c) -> 'a * 'b -> 'c *)
let uncurry f = (fun (x,y) -> f x y)

(* swap : ('a * 'b -> 'c) -> 'b * 'a -> 'c *)
let swap f = fun (b, a) -> f(a , b)

let plus' (x,y) = x + y

(* swap plus' ===> fun (b,a) -> plus' (a,b) *)
```

11.6 Partial evaluation

• A technique for optimizing and specializing programs

Assignment Project Exam Help

- Produce new programs which run faster than originals and guaranteed to behave in same way
- · Whattepsit/of powender.com
 - $\implies \text{It's a function!}$
 - Result fur We chat powcoder
 - * What if we just pass in 3? (plus 3)
 - \cdot fun y -> 3 + y
 - · We generated a function!
- let plusSq x y = $\underbrace{x * x}_{horriblyExpensiveThing(x)}$ + y
 - fun y -> 3 * 3 + y (if we set x as 3), won't evaluate this expensive function until we give it a y
 - If we write:
 - * plusSq 3 10
 - * plusSq 3 15
 - * plusSq 3 20
 - We'd have to evaluate horribly expensive function 3 times.
 - Why not store it and use it for the next computation?

#+BEGIN_SRC ocaml let better PlusSq x = let x = horriblyExpensiveThing(x) in fun y -> x + y #+END_SRC ocaml

- Now we get:
- let x = horriblyExpensiveThing 3 in fun y -> x+y -> fun y ->9+y
 - Now we can use this function to quickly compute without having to do the expensive function
 - Partial evaluation is very important

13 Lecture 13 $< 2017-10-12 \ Thu >$

13.1 Midterm Review

See either 13.ml or Midterm.ml for the questions.

14 Lecture 14 < 2017-10-13 Fri>

How can we do imperative programming (like C) in a functional language?

- So far, expressions in OCaml have:
 - An expression has a type
 - Expression evaluates to a value (or diverges)
- Today:
 - Expressions in OCaml may also have an effect (one effect is allocating values to memory and updating them)

14.1 Overshadowing

Assignment Project Exam Help

```
let (k : int) = 4;;
let (k : int) = 3 in k * k;;
k;; (* Thirtip be 4!/powcoder.com
Binding in line 2 will be gone after line 2.
```

let pi = 3A14; let area Afild We Chat powcoder

```
let a2 = area (2.0)
let (pi : float) = 6.0;;
let b1 = area (2.0) = a2 (* True *)
let area (r:float) = pi *. r *. r;;
let b2 = area (2.0) = a2 (* False *)
```

For b1, calling area will use the old definition of pi (it already evaluated it when we created the function).

14.2 State

How to program with state? We may want to update memory, for example if we have values that change or an array.

• How to allocate state?

```
let x = ref 0
```

Allocates a reference cell with the name x in memory and initializes it with 0. Not the address, cannot do address manipulation.

- How to compare 2 reference cells?
 - Compare their address: r == s
 - * Succeeds if both are names for the same location in memory.
 - Compare their content: r = s

```
let x = ref 0
let y = ref 0
```

Assignment Project Exam Help

- How to read value stored in a reference cell?
 https://powcoder.com
 - let {contents = x} = r

A Pittirn watch on talue that is stored in the reference cell powcoder

• How to update value stored?

```
- x := 3
```

14.3 Demo

```
let r = ref 0;;
let s = ref 0;;
r = s;; (* True *)
r == s;; (* False *)
r := 3;;
(* Update, but it returns a unit, uninteresting
 * Always true, what it says is it succeeded
 * As an effect, it changes the value in cell x.
 * But the _value_ of updating a cell is
 * (). unit is type, it evaluates to ()
```

```
* Keep this in mind*)
!r;;
let x = !r + !s;; (* 3 *)
(* The following is not valid: *)
(* r := 3.4;; *)
(* This is because r is an int ref *)
r := !s;;
!r;;
r := 2+3;; (*2+3 evaluated before stored*)
!r;;
ATS SIGN MENT I PROJECT Exam Help
* So t = r will set t to the same address *)
let t = r;; (* Point to same loc in mem*)
t == r;; https://powcoder.com
!t;;
!r;;
Add We Chat powcoder

(* Polymorphic functions, will see later *)
let id = ref (fun x \rightarrow x);;
id := fun x -> x + 1;;
(* Will fix x to an int *)
(* This won't work: *)
(* id := fun x -> x +. 3.2;; *)
(* Can only do something like *)
id := fun x -> x + 2;;
(* Can also overshadow references *)
let id = ref (fun x \rightarrow x + 1);;
(* Back to the area example *)
let pi = ref 3.14;;
let area r = !pi *. r *. r;;
let a2 = area (2.0);; (*12.56*)
```

```
pi := 6.0;;
let a3 = area (2.0); (*24.0*)
a2 = a3;; (* false *)
(* Now we can write C like
    programs using references *)
(* Purely functional,
 * changes addresses in triple *)
let rot (a,b,c) = (c,b,a);;
(* Purely rotten,
 * changes contents in triple *)
let rott (a,b,c) = let t = !a in (a := !c ; c := t ; (a,b,c)) ;;
Assignment Project Exam Help
rot triple;;
rott triple;;
* since the length of the same thing der com
* More complicated than purely functional ver
 * Considered bad style in functional
 * Harder to reason about its correctness
 * Harder to understand*)
let imperative_fact n =
 begin
   let result = ref 1 in
   let i = ref 0 in
   let rec loop () =
     if !i = n then ()
     else (i := !i + 1; result := !result * !i; loop ())
    in
    (loop (); !result)
  • Updating a cell in memory has
      - a value (i.e. unit, written in OCaml as ())
```

- an effect (i.e. changes the value in cell x)
- Types
 - let r = ref 0
 - * Type of r: int ref
 - * ref 0 is an int ref
 - * 0 is an int
 - * We cannot store a float in r
 - * !r is an int
 - * For r:=3+2 to make sense, r should be an int ref and 3+2must be an int. This returns a type of unit.

Lecture 15 < 2017-10-17 Tue> Assignment Project Exam Help

Given the following expression write down its type, its value (i.e. what the expression evaluates to), and its effect if it has any.

• Usually on exams, they should all type check. The error option is just

- in case they make a typo in typing the question.
- 3+2 Add WeChat powcoder

17.1 Exceptions WeChat powcoder

- Force you to consider the exceptional case
- Allows you to segregate the special case from other cases in the code (avoids clutter!)
- Diverting control flow!

17.1.1 Warm-up

- 3/0
 - Type: int
 - Value: No value
 - Effect: Raises run-time exception Division_by_zero

```
let head_of_empty_list =
    let head (x::t) = x in
head []
```

- Type: 'a
 - head is 'a list -> 'a, so it returns 'a in last line
 - Value: No value
 - Effect: raises run-time exception Match_failure
 - Would have been well-defined if we used option return type

17.1.2 Demo

- 1. Signal Error
 - Ex. raise Domain
- 2. Handle an exception

```
let fact https://powcoder.com

18.1 Backtracking

- General absorbing for faiding all for some volutions incrementally abandons partial candidates as soon as it determines that it cannot lead to a successful solution
- Important tool to solve constraint satisfaction problems such as crosswords, puzzles, Sudoku, etc.
- Ex today:
 - Implement a function change. It takes as input a list of available coins and an amount amt. It returns the exact change for the amount (i.e. a list of available coins, [c1;c2;...;cn] such that c1 + c2 + ... + cn = amt), if possible; otherwise it raises an exception Change.

change : int list (list of coins) -> int (amt) -> int list (list of coins)

- Assumptions:
 - List of coins is ordered

- Each coin in our list can be used as often as needed
- Good practice/exam question

```
let listToString l = match l with
         | [] -> ""
         | 1 ->
                     let rec toString l = match l with
                           | [h] -> string_of_int h
                             | h::t -> string_of_int h ^ ", " ^ toString t
                     toString 1
                                                                  change [50;25;10;5;2;1] 43;;
                              * [25; 10; 5; 2; 1]
                             grment Project Exam Help
                    change [5;2;1] 13;;
* [5;5;2;1] *)
https://powcoder.com
\begin{array}{c} {\tt let\ rec\ change} \; {\tt cdim} \; \overset{\tt let\ rec\ change}{{\tt dif\ amt}} \; \overset{\tt let\ rec\ change}{{\tt dif\ amt}} \; \overset{\tt let\ rec\ change}{{\tt cdim}} \; \overset{\tt let\ rec\ change}{{\tt 
                         match coins with
                         | [] -> raise Change
                          (* Cannot print here, as it won't do any backtracking and
                             * will also give you a type error since it's a unit and we're trying to build a
                          (* raise Change is any type *)
                          | coin :: cs -> if coin > amt then change cs amt
                         else (* coin <= amt*)</pre>
 (* Prepend coin as we're trying to use this coin for result *)
try coin::(change coins (amt - coin) )
                  (* Try, if you fail, try again without given coins*)
with Change -> change cs amt
                 )
```

- Given change [6,5,2] 9
- try 6::change[6;5;2] 3 with Change -> change [5;2] 9
 - change [5;2] 3
 - * change[2] 3
 - * try 2::change[2] 1 will not work, raise Change and get back to change [5;2] 9 from before

Key thing to take away is:

- You can use exceptions for special cases like dividing by 0
- But a more interesting use is that you can divert control flow
- So you can use it to backtrack and solve problems

Assignment Project Exam Help Lecture 19 < 2017-10-26 Thu>

$\underset{\mathrm{Primary \; Benefits}}{\overset{19.1}{\text{Modules}}} s: //powcoder.com$

- Control complexity of developing and maintaining software
- · Split And draw incomplete Line powcoder
- Name space separation
- Allows for separate compilation
 - Don't always want to recompile the whole project after a small change
 - Incremental compilation & type checking
- Incremental development
- Clear specifications at module boundaries
- Programs are easier to maintain and reuse (!)
- Enforces abstractions
- Isolates bugs

19.2 Signatures (Module Types)

- Declarations can be more specific in the signature than what the module actually implements
- Tying a module to a module type we are hiding information!
 - We can change the module implementation in the future and users won't notice as long as it still implements what we specified in the signature
- Order of signature doesn't have to have the same order as module

19.3 Demo

```
(* Want to give an interface to this module

20 Lecture 20 < 2017-10-27 Fri>

20.1 More on Modules

- Can hide information when we bind to a module type
- Don't expose how we implement it
- Can even hide what elements we store in the stack
- Nice level of abstraction, so we can easily rip out the implementation and put in a new one
- Makes programs easy to maintain
- Modules are great for enforcing abstraction

- Want to implement different currencies
- Bank https://powcoder.com
- Money

```
module typa CURRING We Chat powcoder
```

```
type t
  val unit : t
  val plus : t -> t -> t
  val prod : float -> t -> t
  val toString : t -> string
  end;;

(* Here, float is not yet tied to currency *)
(* Ideally, we'd also like to define multiple currencies *)
module Float =
  struct
  type t = float
  let unit = 1.0
  let plus = (+.)
  let prod = ( *. )
  let toString x = string_of_float x
```

```
end;;
(* Abbreviation for a module *)
(* module Euro = Float *)
(* But we don't just want to abbreviate it,
   * want to also say it implements currency *)
module Euro = (Float : CURRENCY);;
module USD = (Float : CURRENCY);;
module CAD = (Float : CURRENCY);;
module BitCoins = (Float : CURRENCY);;
(* All these currencies use the same implementation of float,
  * but all referring to different implementations
   * Important that we specify CURRENCY here rather than in float
  * so that they can be different
      Want to keep abstraction. We made plus and prod require Furos
 Assignment fro 1ect exam h

Post.print_balance my_account;;
Post_Client.print_balance my_account;;
(* Shared functionality among the two, but different ways of accessing *)
```

```
module Citybank = Old_Bank (USD);;
module Citybank_Client : (CLIENT with type currency = Citybank.currency and type t = Citybank.create ();;
Citybank_deposit my_cb_account (usd 50.00);;
(* Citybank_Client.deposit my_account;; Won't work *)
```

21 Lecture 21 < 2017-10-31 Tue>

21.1 Continuations

A **continuation** is a representation of the execution state of a program (for example a call stack) at a certain point in time.

Save the current state of execution into some object and restore the state from SIS 102 of 111 211 to it is interesting the state of th

21.1.1 First-class Support for Continuations

Ocaml doesn't have first-class support, so we'll be using functions as continuations! Back to higher order functions.

• Back to the beginning: Recall what tail-recursive means. Can every recursive function be written tail-recursively?

- Not tail-recursive, because of h::append t k
- But still efficient
- Can we rewrite it tail-recursively?

21.1.2 Recipe

How to re-write a function tail-recursively?

- Add an additional argument, a continuation, which acts like an accumulator
- In the base case, we call the continuation
- In the recursive case, we build up the computation that still needs to be done.

A continuation is a stack of functions modeling the call stack, i.e. the work we still need to do upon returning.

• Not always easy to do this, the earlier attempt at tail recursion for append reversed the list.

```
(* append: 'a list -> 'a list -> 'a list *)
let rec ahettps://poweoder.com
  | [] -> k
  | h::t -> h::(append t k)
(* Tail readd *)WeChat powcoder
(* app_tl: 'a list -> 'a list -> ('a list -> 'a list) -> 'a list *)
(* First 'a list in c is "waiting for result" of rec call
   and last one is final result *)
let rec app_tl l k c = match l with
(* | [] -> ?
 * | h::t -> app_tl t k ? *)
(* How to do this? Need something with a hole, i.e. a function *)
  (* When you do app [1;2] [3;4] ([3;4=k]) -> 1::app [2] [3;4]
   * \rightarrow 1::2::app [] [3;4] What to give to c here? [3;4]*
  (* c = (fun r \rightarrow 1::2::r) *)
  (* Parameterized function, can call and start using *)
  (* c k \rightarrow 1::2::[3,4] *)
  | [] -> c k (* Calling the continuation
       - passing to the call stack k*)
  (* What to put here? *)
  (* | h::t -> app_tl t k (fun r -> h :: c r) *)
```

```
(* This gives reverse order *)
  (* Building up the call stack: *)
  (* app_tr [1;2] [3;4] (fun r -> r) (initial continuation), ident
   -> app_tr [2] [3;4] (fun r1 -> (fun r->r) (1::r1))
   -> app_tr [] [3;4] (fun r2-> (fun r1 -> (fun r->r) (1::r1))) (2::r2)
   Collapsing the call stack
   \rightarrow (fun r2 \rightarrow (fun r1 \rightarrow (fun r \rightarrow r) (1::r1)) (2::r2)) [3,4]
   \rightarrow (fun r1 \rightarrow (fun r\rightarrow r) (1::r1)) [2;3;4]
   \rightarrow (fun r->r) [1;2;3;4] \rightarrow [1;2;3;4] *)
  | h::t \rightarrow app_tl t k (fun r \rightarrow c (h::r))
let rec genList n acc =
  if n > 0 then genList (n-1) (n::acc) else acc;;
Assignment Project Exam Help
let 12 = genList 4000000 [];;
(* append http://powcoder.com
 * Ocaml didn't implement it through tail-recursion
 * For short lists, it works faster
 * But it cannot appear the historia control of the Program can crash vs program being a bit slower*)
app_tl 11 12 (fun r -> r);;
let rec map l f = match l with
  | [] -> []
  | h::t -> (f h)::map t f
(* Past interview question, wanted to reimplement map tail recursively *)
let map' 1 f =
  let rec map_tl l f c = match l with
    | [] -> c []
    (* Build up calling stack *)
    | h::t -> map_tl t f (fun r -> c ((f h):: r))
  map_tl l f (fun r -> r)
```
